

$p \rightarrow \text{next} = \text{new node};$  // ①  
 $p = p \rightarrow \text{next};$  // ②  
 $p \rightarrow \text{data} = x;$   
 $p \rightarrow \text{next} = \text{NULL};$  // ③

"invariant"

Issue: requires special case for first node, since  $L$  is not the .next of anything!

To remove special case:

Alternative #2:

General case:

node \*\*  $p = \&L;$

$*p \equiv$  next of very last node

$*p = \text{new node};$

Exercise: search for an integer, and add a new node w/ data 99 after it.

// linear scan .... // ①

Node\*  $n = \text{new node};$

$n \rightarrow \text{data} = 99;$

$n \rightarrow \text{next} = p \rightarrow \text{next};$  // ②

$p \rightarrow \text{next} = n;$  // ③

// Note: this works even if  $p$  is pointing to the last node. (But does require  $p \neq \text{NULL}!$ )
